

## **Power Bi Service Assignment**

### **1.After how much duration of inactivity, scheduled refresh will get pause?**

In **Power BI**, scheduled refresh for a dataset **gets paused after 2 months (60 days)** of inactivity.

Inactivity means **no user has visited any dashboard or report built on the dataset** during that time.

- You'll see a warning in the Power BI Service stating:  
*"Scheduled refresh has been paused due to inactivity."*

### **2.For which licensed user, dataflow creation is possible?**

To **create dataflows in Power BI**, a user must have one of the following:

- **Power BI Pro license** or
- **Power BI Premium Per User (PPU) license** or
- Be working in a **workspace backed by a Power BI Premium capacity** (P SKU or EM SKU assigned to the workspace)

So in summary:

- **Pro or PPU licensed users** can create dataflows.
- **Free users cannot create dataflows** unless the workspace is in a **Premium capacity** and they have the necessary permissions.
